### HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

If the SMALL ENTITY is shown as NO:

A. Pay TOTAL FEE(S) DUE shown above, or

II. PART B - FEE(S) TRANSMITTAL, or its equivalent, must be completed and returned to the United States Patent and Trademark Office (USPTO) with your ISSUE FEE and PUBLICATION FEE (if required). If you are charging the fee(s) to your deposit account, section "4b" of Part B - Fee(s) Transmittal should be completed and an extra copy of the form should be submitted. If an equivalent of Part B is filed, a request to reapply a previously paid issue fee must be clearly made, and delays in processing may occur due to the difficulty in recognizing the paper as an equivalent of Part B.

**EXAMINER'S AMENDMENT**

Claims 9, 11-13, 19, and 21-25 are allowed.

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Mr. Larry Nixon on December 2<sup>nd</sup>, 2008.

The application has been amended as follows:

19. (Currently Amended) A process for obtaining an ASL image of an image region to be imaged in a subject by performing scans independently in (a) a control mode, and (b) a tag mode according to an MRI pulse sequence based on an ASL technique, said method comprising:

providing an MRI pulse sequence controller, wherein the controller is configured to apply to said subject:

(a) a slice-selective pulse that spatially selects a region outside said image region and excites magnetization spins within said image region for the spins to undergo transition to transverse magnetization and thereafter

(b) applying a velocity-selective pulse train that selectively excites magnetization spins having a constant velocity range in a region including said image region for the spins to undergo transition to transverse magnetization, and then applying excitation to cause the transverse magnetization to flip back to longitudinal magnetization, followed by

(c) applying an imaging pulse train,

said velocity-selective pulse train including (a) a first flip pulse, (b) an inversion pulse after said first flip pulse, (c) a second flip pulse after said inversion pulse, (d) a velocity encode pulse (i) in a period after said first flip pulse and before said inversion pulse, and (ii) in a period after said inversion pulse and before said second flip pulse, and (e) a gradient magnetic field pulse applied together with said first and second flip pulses and said inversion pulse to spatially select a region including said image region;

thereby generating an image of the subject.

21. (Currently Amended) An MRI method for obtaining an ASL (Arterial Spin Labeling) image of an image region to be imaged in a subject by performing scans independently in (a) a control mode, and (b) a tag mode according to an MRI pulse sequence based on an ASL technique, said method comprising:

providing an MRI pulse sequence controller, wherein the controller is configured to apply to said subject:

an ASL MRI pulse sequence which includes (a) a slice-selective pulse that spatially selects an upstream region outside said image region and excites transverse magnetization spins within said upstream region, and

(b) a velocity-selective pulse train that selectively excites transverse magnetization spins having a constant velocity range in a region including said image region, and then performs excitation to cause the transverse magnetization spins to flip back to longitudinal magnetization,

said velocity-selective pulse train including (a) a first flip pulse, (b) an inversion pulse after said first flip pulse, (c) a second flip pulse after said inversion pulse, (d) a velocity encode pulse (i) after said first flip pulse and before said inversion pulse, and

(ii) after said inversion pulse and before said second flip pulse, and (e) a gradient magnetic field pulse applied together with said first and second, flip pulses as well as said

inversion pulse to spatially select a region including said image region;

thereby generating an ASL image of the subject.

24. (Currently Amended) An MRI method for obtaining an ASL (Arterial Spin Labeling) image of an image region in a subject by performing scans independently in (a) a control mode, and (b) a tag mode according to an MRI pulse sequence based on an ASL technique, said method comprising:

providing an MRI pulse sequence controller, wherein the controller is configured to apply to said subject:

an ASL MRI pulse sequence which includes a pulse train that (a) spatially selects an upstream region outside said image region to be imaged and provides transverse magnetization spins within said upstream region, and (b) selectively excites transverse magnetization spins having a constant velocity range in a region including said image region causing the spins to undergo transition to transverse magnetization, and then performs excitation to cause the transverse magnetization spins to flip back to longitudinal magnetization spins,

Art Unit: 3768

said pulse train applying (i) a first-flip pulse, (ii) an inversion pulse after said first flip pulse, (iii) a second flip pulse after said inversion pulse, (iv) a velocity encode pulse (a) in a period after said first flip pulse and before said inversion pulse, and (b) in a period after said inversion pulse and before said second flip pulse, and (v) a gradient magnetic field pulse together with said first and second flip pulses as well as said inversion pulse to spatially select a region including said image region; and generating an image of the subject, based on said ASL imaging process.

25. (Currently Amended) An ASL (Arterial Spin Labeling) imaging method for obtaining an ASL image of an image region to be imaged in a subject by performing scans independently in (a) a control mode, and (b) a tag mode according to an MRI pulse sequence based on an ASL technique, said method comprising:

providing an MRI pulse sequence controller, wherein the controller is configured to apply to said subject:

an ASL MRI pulse sequence which includes (a) a slice-selective pulse that spatially selects a region outside said image region and excites magnetization spins within said image region for the spins to undergo transition to transverse magnetization and thereafter (b) a velocity-selective pulse train that selectively excites magnetization spins having a constant velocity range for the spins to undergo transition to transverse magnetization, and then an excitation to cause the transverse magnetization to flip back to longitudinal magnetization, followed by (c) an imaging pulse train,

said velocity-selective pulse train including (a) a first flip pulse, (b) an inversion pulse after said first flip pulse, (c) a second flip pulse after said inversion pulse, (d) a velocity encode pulse (i) in a period after said first flip pulse and before said inversion pulse, and (ii) in a period after said inversion pulse and before said second flip pulse, and (e) a gradient magnetic field pulse applied together with said first and second flip pulses as well as said inversion pulse to spatially select a region including said image region;

thereby generating an image of the subject, based on said ASL imaging process.

The following is an examiner's statement of reasons for allowance: the closes prior art of record are U. S. Patent No. 6,717,405 to Alsop (Abstract and Col. 5 lines 25-52); NPL titled "Velocity Selective Arterial Spin Labelin'" by Wong et al.; U. S. Patent No. 7,328,054 to Jesmanowicz; U. S. Patent No. 6,618,609 to

Art Unit: 3768

Liu et al.; and U. S. Patent No. 6,564,080 to Kimura et al. None of the prior art alone or in combination teaches An ASL imaging method which includes a control mode, a tag mode and a velocity pulse train, wherein said velocity pulse train comprises a first flip pulse, an inversion pulse, a second flip pulse, a velocity encoded pulse and a gradient magnetic field pulse.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Any inquiry concerning this communication or earlier communications from the examiner should be directed to SANJAY CATTUNGAL whose telephone number is (571)272-1306. The examiner can normally be reached on 9:30 - 5:00 pm.
